Total Applications

Below is a figure of Total applications recieved by year from 2014 to 2014 Pay close attention to the ordinate scale since it will almost never start at 0 and scales according to the counts of applications for the respective years. Generally you want to see applications increase every year but expect some cyclical trends that might obscure the true trend. Cyclical trends don't become aparent till we see several cycles.

```
## geom_path: Each group consists of only one observation. Do you need to  
## adjust the group aesthetic?
```

Offers, Rejections and Cancelled Applications

Below is a figure of offers, rejections and cancelled applications by year from 2014 to 2014. Pay close attention to the ordinate scale since it might start at 0 and end at a relatively high number which can hide serious trends. As your total applications increase don't be surprised to see any or all of these values increase. With large decreases in total applications we might expect that rejections to be affected the most. If we were to test if a large increase in rejections was significant or not we would test the proportions and not the raw values of rejections. We might expect there to be cyclical trends in any of these groups but typically cyclical trends aren't visible till several cycles.

```
## geom_path: Each group consists of only one observation. Do you need to
## adjust the group aesthetic?
```

Accepted and Declined Offers

Below is a figure of accepted and declined offers by year from 2014 to 2014. Pay close attention to the ordinate scale since it might start at 0 and end at a relatively high number which can hide serious trends. As your offers extended increase don't be surprised to see any or all of these values increase. We might expect there to be cyclical trends in any of these groups but typically cyclical trends aren't visible till several cycles.

```
## geom_path: Each group consists of only one observation. Do you need to
## adjust the group aesthetic?
```

tionary Admission Accepted — Probationary Admission Declined — Regular Admission Accepted — F

Go Baylor

Below is a figure of Go Baylor numbers by year from 2014 to 2014. Pay close attention to the ordinate scale since it might start at 0 and end at a relatively high number which can hide serious trends. As your total Go Baylor numbers increase, don't be surprised to see any or all of these values increase. With large decreases in Go Baylor numbers, we might expect that mark paid entries to be affected. If we were to test if a large increase in mark paid entries was significant or not, we would test the proportions and not the raw values of mark paid entries. We might expect there to be cyclical trends in any of these groups, but typically cyclical trends aren't visible till several cycles.
